## Street Quick Performance (WA) 9/11/2021 - VDJ Upgrade Results with the new NPC Clutch

"Andrew was suffering with low performance from his VDJ79. As is well known in the market, these things are massively under rated from the factory. He inquired about doing one of SQP stage on upgrades including remap and exhaust but after a brief conversation- boost and fuel were to be introduced via a GTurb upgrade and injectors! Let the game begin.

Red wheel was fitted up and a set of Piezo plus 30s inserted along with a intake clean on the 80000km old engine. Run of the mill MANTA stano 3" turbo back system installed with the man of all clutches- the NPC1600. Standard cross over left for boost response as with OEM air box and plumbing.

Onto the dyno and the gains were immediate. First pull it was straight over the 300 rwhp mark. Some careful mapping followed cleaning up the AFR shown here with real resolution. Super clean 16:1! Boost was kept at a modest 28psi which is well in the sweet spot of the turb enabling the OEM cooler to get it done. Intake and cooler upgrades we have seen boost into the early 30s and with this much injector available, it wouldn't be hard to see this thing pushing into the 350rwhp region.

We have posted graphs showing torque both at the wheel and calculated back to the flywheel. Now the factory rate these big girls at a hobbled 430nm. This jigger put down pretty much that on arrival. After mods it shows OVER 1000nm! Now this is calculated and are we claiming it? Nope! But we will safely say it is making well over 2x the factory rated torque right now!!

Another whole bunch of myths busted on this one yet again. Factory intake, factory cooler, factory cross over, single 3" exhaust and it is punching out over 320rwhp! Some are sold many of the mentioned items to make just on 200hp! SQP prides itself on delivering the best value for money packages on all platforms we work on. Bang for the Buck! Proven performance"
